Statistical Reporting Service

Acknowledgment

The acreage, production, utilization, monthly and season average price, and crop value statistics for Florida as shown in this summary are official estimates of the Florida Crop and Livestock Reporting Service. Corresponding data for other citrus states are from official reports of the USDA, Statistical Reporting Service. Canned and frozen pack statistics were compiled by the Florida Citrus Processors Association. Where data are from other sources, appropriate references appear.

Records of the Division of Fruit and Vegetable Inspection, Florida Department of Agriculture and Consumer Services, were employed in production and utilization estimates. The Citrus Administrative Committee assisted in assembling these data.

Many producers, shippers, canners, sales agencies, transportation firms, and others associated with the citrus industry voluntarily supplied basic data used to develop these statistics. Their contributions are sincerely appreciated.

The report was assembled under the direction of James W. Todd and Robert R. Terry of the Florida Crop and Livestock Reporting Service.

FLORIDA WEATHER HIGHLIGHTS, SELECTED AREAS AND MONTHS, 1983-84 CROP YEAR

Central Florida citrus growing areas experienced some of the worst temperature extremes on record. Highs in the 80's and lows in the 20's and teen's, occurring within the same week in December, led to the most destructive freeze of this century. The hard freeze of December 25-26 was preceded by unseasonably warm temperatures which continued to stimulate tree growth and did not promote semi-dormancy.

By the beginning of harvest in September cumulative rainfall amounts were above normal for most reporting stations in the central and south Florida growing areas. With the absence of severe freezing temperatures in the previous winter, trees had made excellent recovery from the 1980-81 and 1981-82 freezes.

The first low pressure system, preceded by varying amounts of rainfall, moved through the State during the last week of September. Temperatures were 2 to 4 degrees below normal but daytime highs reached the mid-to-upper 80's most days.

October weather was marked by above average temperatures in the absence of cool fronts. Daytime highs in the 80's and 90's in some areas and showers on a regular basis kept trees in an active growing condition with many groves showing good flushes of new growth.

Frequent scattered rainfall continued into November with a cool front moving through the State the second week. Lowest temperatures were in the high 30's and low 40's on several mornings. By the first week of December, temperature averages again climbed to above normal levels with daily highs in the mid-to-upper 80's.

Temperature averages remained at or above normal levels until a fast moving high pressure system entered the State from the northwest in the late evening of

December 24. By early morning, temperatures had plunged to the low 20's and upper teens in most interior and upper West Coast growing areas. The cold, north-west wind continued to hold temperatures down all Christmas Day, and daytime highs reached only the mid 30's, breaking many long time records. Many stations in the northern citrus growing area reported 32 degrees or below by 6 P.M. on Christmas Day.

By the morning of December 26, low temperature readings in the teens and low 20's were again reported. Lowest readings generally did not set new levels, but record durations below 32 degrees were reported in many areas.

January temperature averages were generally below normal, but daytime highs frequently reached the 70's and 80's with light amounts of rainfall reported regularly.

Temperatures in early February were below average levels but higher by mid-month. Another cool front the last of February and first of March saw temperatures in the mid-and-low 30's on several mornings, but little or no additional damage to citrus was reported.

Rainfall in the spring was very scattered. Most stations reported below normal cumulative amounts by April 1 with some in the southern interior and lower East Coast areas reporting above normal amounts.

April was unseasonably cool, with average temperatures 4 to 6 degrees below normal in most areas. But by late April and early May, daytime highs reached into the 80's and low 90's. Except for several weeks of hot, dry conditions in late May, rainfall amounts during the summer continued at near normal levels in most areas.

1983-84 PRODUCTION AND TREE CENSUS

Florida's season began with a normal bloom period extending from mid-March to mid-April. Spring temperatures were slightly below normal ranges and cumulative rainfall amounts were above in most citrus growing areas. Trees had made an excellent recovery from the January 1981 and 1982 freezes.

By late summer a good crop had been set. The initial October forecast was for 168 million boxes of oranges, up sharply from the previous two seasons. Grapefruit were forecast at 46 million boxes, 14 percent more than the 1982-83 season. Weather was warm with only one cool snap prior to the December 25-26 freeze. Weather highlights for the season are described on the preceding page.

Final orange production at 116,700,000 boxes was 31 percent less than the pre-freeze forecast. Grapefruit production at 40,900,000 boxes was 11 percent less than the October forecast. Grapefruit loss was not as severe because of the large amount of grapefruit in the East Coast growing areas where freezing temperatures were of shorter durations.

FCOJ yield was final at 1.28931 gallons per box. This was 10 percent less than the 1.43 gallons estimated in the October forecast.

California's production of 48,300,000 boxes of oranges was substantially less than the 76,100,000 boxes harvested in the previous season. Grapefruit production was 6,440,000 boxes, slightly less than the 7,300,000 boxes in the previous season.

Arizona orange production at 1,800,000 boxes was substantially less than the previous record high crop of 3,800,000 boxes. Grapefruit production was slightly less than the previous season.

Texas suffered big losses from the December freeze. Final orange production at 2,510,000 boxes was 56 percent less than the previous season. Valencia oranges, which were not sufficiently mature for harvest were almost a total loss. Grapefruit production at 3,200,000 boxes was 71 percent less than the 11,200,000 boxes produced in the previous season.

TREE CENSUS

The Florida Crop and Livestock Reporting Service first began indexing the State's commercial citrus groves on aerial photography as of January, 1966. Ground crews in 4-wheel drive vehicles

identify all the State's groves by year in which set, fruit type, and row spacing. Photo interpreters in the Orlando office then delineate the groves by variety blocks on positive photo transparencies at a scale of 1 inch to 660 feet. Variety blocks are measured with planimeters to obtain acreage and then indexed by land section.

The 1966 survey indicated there were 66,441,000 commercial citrus trees on 858,082 net acres of land. In addition, the survey provided acreage and number of trees by county, variety and year set. But, of equal importance, the inventory was designed for quick and economical updating. Since that time, the production area has been resurveyed each second winter--1968 through 1984--to determine changes.

Photographing begins in November when weather conditions are most favorable and is generally completed in 80 to 90 days. The same three-mile-wide flight lines established in 1966 are photographed on each succeeding flight. Approximately 14,000 square miles of photography is obtained at a 1 to 30,000 scale.

The latest survey, conducted after the December, 1983 freeze, indicated 761,365 acres of commercial citrus in Florida. It was not possible to visit all citrus groves in the heavily damaged West Coast and Upper Interior growing areas, so a sample survey was used to estimate the number of trees remaining alive after the freeze. The Lower Interior and East Coast growing areas were surveyed with usual procedures, using ground checking based on changes detected by the aerial photography flown in the winter months.

The gross loss of 159,719 acres since 1982 reflects losses from the freeze as well as normal attrition occurring at the rate of about two percent per year. An undetermined amount of acreage that was alive in the spring of 1984 will undoubtedly be lost as well. Growers had not decided in many instances whether to remain in business or not. During the two year interval 73,228 acres of new citrus was set, partially offsetting the severe reduction due to the December 1983 freeze. Nearly all of the new acreage was set along the southern end of the citrus belt.

Florida, all citrus: Acres in commercial groves as of January, 1966 - 1984, with percent changes

Year:	Acres	: Change from previous survey:	Change from 1966 survey Percent
1966	858,082	---	---
1968	931,249	+8.5	+8.5
1970	941,471	+1.1	+9.7
1972	878,019	-6.7	+2.3
1974	864,098	-1.6	+0.7
1976	852,369	-1.4	-0.7
1978	831,235	-2.5	-3.1
1980	845,283	-1.7	-1.5
1982	847,856	+0.3	-1.2
1984	761,365	-10.2	-11.3

1983-84 VALUE OF SALES, PRICES AND EXPORTS

VALUE

The preliminary on-tree value of all citrus for the 1983-84 season is \$746,515,000. This is 15 percent less than the revised 1982-83 value of \$876,777,000 and 28 percent less than the record high 1979-80 season total of \$1,037,050,000.

Preliminary value is based on that part of the crop that was priced at harvest, about 30 percent of the total. When all participation plans and cooperative prices are finalized, a revised value is calculated.

The 1983-84 preliminary season on-tree price of oranges was \$4.96 per box, slightly less than the revised 1982-83 price of \$5.15 per box. A high proportion of the early-midseason oranges was harvested after the December 25, 1983 freeze and this salvaged fruit brought low per pound solids prices as well as being reduced in solids per box. Processing early-mids returned only \$3.65 per box, the lowest in several seasons. The Valencias that remained on the trees after the freeze returned \$6.37 per box for processing compared to \$5.48 the previous season, reflecting the reduced crop size caused by the Christmas freeze.

Grapefruit prices strengthened after the freeze and the preliminary average was \$2.57, up 31 percent from the previous season's revised \$1.96 per box. Fresh prices were up slightly, but the major increase was from higher processing returns. All grapefruit for processing returned \$1.45 per box compared to \$.52 per box in the 1982-83 season.

The 1983-84 season delivered-in price for all priced fruit going into FCOJ was \$1.21 per pound of solids as compared to \$1.14 per pound in the 1982-83 season. Early and mid varieties were \$1.06 per pound and Valencias were \$1.42.

FLORIDA, ALL CITRUS: Value of sales on-tree, crop years 1974-75 through 1983-84

Crop : year	Value :1,000 dol.	Crop : year	Value :1,000 dol.

1978-79	966,916	1983-84 2/	746,515

1/ Revised. 2/ Preliminary.

COUNTY PRODUCTION

Estimates of citrus production by counties were prepared from objective survey data obtained from the citrus crop estimates program. Production for Florida has been distributed to counties based on the biennial citrus tree census, limb count survey data adjusted for droppage to end of season, and size data at maturity.

Tree numbers by county which are used in the estimates were obtained from the latest tree census. Data on production are obtained from several objective fruit surveys: limb count and size and

droppage samples. Because of the statistical sampling design, counties with higher production in general have a greater number of fruit samples, and therefore estimates for these counties can be considered more reliable. Thus, for the same reason, estimates for the production areas are still more reliable.

PRICES

All on-tree prices represent the average price received by growers for their fruit by types. Prices are based on records of commercial fresh fruit and processed fruit returns. The term "on-tree" relates to fruit value before it is picked and hauled from the grove.

Each season, beginning with the first month that three percent of a fruit type is harvested, estimates are computed. Fresh fruit sales organizations and a mail-out questionnaire to packers provide the average F.O.B. price, and processors supply an average spot and cash price for fruit delivered to plants. From these values, an estimated charge for picking, hauling and packing is deducted to arrive at an on-tree price. The anticipated box utilization for the month is used to combine the fresh and processing price to obtain an average price for all methods of sales. At the end of the season, monthly price averages are computed and weighted by boxes utilized, to provide the preliminary season average price.

A year later, after most processed products are sold, cooperatives and firms with participation plans report prices of fruit they handled. These prices, combined with the spot and cash prices collected earlier, are weighted together, by varieties, to determine the final processing price received by growers. From this price, charges for picking, hauling and packing, as determined by University of Florida economists, are deducted to arrive at the final on-tree price received by growers.

FOREIGN EXPORTS

Fresh exports of citrus to countries other than Canada and Mexico for the 1983-84 season totaled 10,038,000 cartons, up slightly from the previous season. Grapefruit, principally to Japan, accounted for over 99 percent of the total exports. Orange exports were down to only 42,000 cartons. Tangerines, mostly to Puerto Rico, decreased slightly to 44,000 cartons and were mostly Honey Tangerines.

Frozen concentrated orange juice (FCOJ) is Florida's major processed product sold in export markets and amounted to 12.8 million gallons in the 1983-84 season. This compared to the 12.5 million gallons exported in the 1982-83 season. Canada is the major market for U. S. exports. Increasing Brazilian production and the severe Florida freeze have limited export expansion opportunities for Florida FCOJ.

History of Florida's Citrus Industry

The citrus tree is a native of the Orient. From this area it was carried ever westward by man, to India, to the Mediterranean and on across the Atlantic. Citrus was brought to the Americas by Columbus. When he landed on November 22, 1493, he brought citrus seeds that were planted on the island of Haiti. The first seeds planted on the mainland of the Americas were brought by the expedition of Juan de Grijalva when he landed in Central America between July 12 and July 20, 1518. The exact date of the introduction of citrus trees into Florida is not known, but from a statement made by Pedro Medendez, dated April 2, 1579, it appears that citrus fruits were grown in abundance around St. Augustine at that time. Early settlers in Florida some two centuries later found wild citrus trees scattered over the State. One of the oldest, cultivated groves planted in Florida (Hume, 1926 p.95) is thought to be the Don Phillippe grove in Pinellas County, planted sometime between 1809 and 1820.

Citrus production in Florida had reached an all time high of more than 5 million boxes when the Great Freeze of 1894-95 almost totally wiped out the citrus industry. It was not until 1909-10 that this level was reached again. Since that time the volume steadily increased. As the decade of the seventies began, Florida's dominance of the Nation's citrus became even more apparent. In 1983-84, Florida had 70.1 percent of the Nation's production.

Footnote 2/ for page 32, 1/ for pages 33 and 34. Final Mexican shipments to the U. S. are reported by FAS as a combined total for oranges and tangerines. The total shown on pages 32 through 34 has been broken down proportionally into oranges and tangerines from Plant Quarantine data reported at the time of the crossing. Plant Quarantine releases give separate totals for these two types of citrus. Mexican shipments, through the U.S. to Canada are not included.
